An Overview of Pro/ENGINEER

The Foundation of Pro/ENGINEER

What is Pro/ENGINEER?

Pro/ENGINEER is a computer graphics system for modeling various mechanical designs and for performing related design and manufacturing operations. The system uses a 3D solid modeling system as the core, and applies the feature-based, parametric modeling method.

In short, Pro/ENGINEER is a feature-based, parametric solid modeling system with many extended design and manufacturing applications.

</table>
How is Pro/ENGINEER different from other CAD systems?

Pro/ENGINEER was the first CAD system entirely based upon feature-based design and parametric modeling. Today most software producers have recognized the advantage of this approach and shifted their product onto this platform. Nevertheless, the differences between a feature-based, parametric solid modeling CAD system, and a conventional CAD system include:

**Pro/ENGINEER**
- Solid Model
- Parametric Model
- Feature-Based Modeling
- Single Data Structure and Full Associativity
- Subject-Oriented Sub-Modeling Systems
- Manufacturing Information Associated with Features
- Generation of an Assembly by Assembling Components

**Conventional CAD Systems**
- Wireframe and Solid Model
- Fixed Model
- Primitive-Based Modeling
- Function-Oriented Data Structure and Format Interpreters
- A Single Geometry-Based System
- Texts Attached to Geometry Entities
- Generation of an Assembly by Positioning Components
Ease of Use:
• Pro/ENGINEER was designed to begin where the design engineer begins with features and design criteria, through cascading menus.
• Expert users employ "map keys" to combine frequently used commands along with customized menus to exponentially increase their speed in use.
• Pro/ENGINEER provides the ability to sketch directly on the solid model, feature placement is thus simple and accurate.

Full Associativity: Pro/ENGINEER is based on a single data structure, with the ability to make change built into the system. Therefore, when a change is made anywhere in the development process, it is propagated throughout the entire design-through-manufacturing process.

Parametric, Feature-Based Modeling:
• Pro/ENGINEER's features contain non-geometric information, such as manufacturing processes and associated costs, as well as information about location and relationships.
• This means that features do not require coordinate systems for placement, and they "know" how they are related to the rest of the model. As a result, changes are made quickly and always adhere to the original design intent.
**Powerful Assembly Capabilities:**

- Assembling components is easy with Pro/ENGINEER. Simply tell the system to "mate," "insert," or "align" the components. They are assembled, always maintaining the design intent.
- Components "know" how they are related, so if one changes, either positionally or geometrically, the other will change accordingly. Parts can be designed right in the assembly and defined by other components, so if they move or change size, the part will automatically update to reflect the change.

**Robustness:** The Pro/ENGINEER family of products is based on a double precision, non-faceted solid modeling core. This provides the engineer with the most accurate representation of geometry, mass properties, and interference checking available.

**Change Management:** Powerful change capabilities are inherent with Pro/ENGINEER full associativity, enabling design-through-manufacturing disciplines to execute their functions in parallel.

**Hardware Independence:**

- Pro/ENGINEER runs on all of the major UNIX and Windows platforms, maintaining the same look and feel on every system.
- Users can select the most economical hardware configuration for their needs, and mix and match any combination of platforms.
Pro/ENGINEER Functionality

The basic functionality of Pro/ENGINEER is broken into four major areas:

• Part Modeling and Design
• Assembly Modeling and Design
• Design Documentation (Drawing Generation)
• General Functionality
Pro/E Modeling

**BASE FEATURE**
- Default datum planes.
- Provides assembly and construction references.

**SKETCHED FEATURE**
- Revolved protrusion.
- Symmetry captured in sketch.
- Dimensioned for easy modification.

**FINISHED PART**
- Composed of several features.
- Patterned spoke holes.
- Relation maintains spacing of spoke holes.

**SUBASSEMBLY**
- Composed of several parts.
- Tire created from rim.
- Spokes reference hub hole patterns.
- Family tables of hub and rim parts for rear wheels.

**FINAL ASSEMBLY**

**Virtual & Build in Features**

**Sketched Features**
Part Design and Modeling

Defining Geometry - Feature-Based Design
• Create **sketched features** including protrusions, cuts, and slots made by either extruding, revolving, or sweeping along a **2D sketched trajectory**, or blending between parallel sections
• Create **pick and place features**, such as holes, shafts, chamfers, rounds, shells, regular drafts, flanges, ribs, etc.
• Sketch **cosmetic features**
• **Reference datum** planes, axes, points, curves, coordinate systems, and graphs for creating non-solid reference datum

Manipulating Geometry and Parametric Modeling
• Modify, delete, suppress, redefine, and reorder features, as well as making features "read-only"
• Create **table-driven parts** by adding dimensions to the family table
• Capture **design intent** by creating relations between part dimensions and parameters
• Generate **engineering information**, including mass properties of parts, model cross sections, and reference dimensions
• Create geometric **tolerances** and surface finishes on models
• Assign **density**, **units**, **material properties** or user-specified mass properties to a model
• Additional functionality available through Pro/FEATURE.
Assembly Design

- Place components and subassemblies using commands like **mate**, **align**, and **insert** to create full product assemblies.
- **Disassemble** components from an assembly.
- Modify assembly placement **offsets**.
- Create and modify **assembly datum planes**, coordinate systems, and cross sections.
- Modify part dimensions in assembly mode.
- Generate **engineering information**, bills of materials, reference dimensions, and assembly mass properties.
- Additional functionality available through **Pro/ASSEMBLY**.
Design Documentation (Model → Drawings)

- Create numerous types of **drawing views**, including general, projection, auxiliary, detailed, exploded, partial, area cross-section, and perspective
- Perform extensive **view modifications**, including changing the view scale and the boundaries of partial or detailed views, adding projection and cross-section view arrows, & creating snapshot views
- Create drawings with multiple models, delete a model from a drawing, set and high-light the current model of a drawing
- Use a sketch as a parametric drawing format
- **Manipulate dimensions**, including show, erase, switch view, flip arrows, move dimensions, text, or attach points
- **Modify dimension** values and number of digits
- Create, show, move, erase, and switch view for standard **notes**
- Include existing **geometric tolerances** in drawing notes
- Update the model geometry to incorporate design changes
- **Markup** drawings to indicate changes to be made
- Export a **drawing IGES file**
- Additional functionality available through **Pro/DETAIL.**
General Functionality

- Database management commands
- Layer control for placing items on a layer and displaying layers
- Measuring commands for distance, geometric information angle, clearance, and global interference on parts and assemblies
- Viewing capabilities to pan, zoom, spin, shade, and re-orient models and drawings.
The Function Modules of Pro/ENGINEER

The core of Pro/ENGINEER is the feature-based, parametric solid modeling system for modeling mechanical parts.

The part model created by this system can be used to form mechanical assemblies and to produce engineering drawings.

The model can also be used to carry out many other related analysis, simulation, planning and manufacturing activities such as the generation of CNC tool paths and Bills of Material. These extended functions are reflected by the following example Pro/ENGINEER modes.
## BASIC MODES

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sketcher</td>
<td>Define the 2D cross-section (or section) of an object model for sweeping.</td>
</tr>
<tr>
<td>Part</td>
<td>Create the solid model of a part.</td>
</tr>
<tr>
<td>Assembly</td>
<td>Form the solid model of an assembly of multiple components.</td>
</tr>
<tr>
<td>Drawing</td>
<td>Produce engineering drawings of parts and assemblies created in Pro/ENGINEER. These drawings are fully associative with the 3D solid model. When a dimension in the drawing is changed the dimension of the associated 3D model(s) will be automatically updated, and vice versa.</td>
</tr>
</tbody>
</table>

These are frequently used Pro/ENGINEER modes.
