Welcome to SENG 371 Software Evolution Spring 2013

A Core Course of the BSEng Program

Hausi A. Müller, PhD PEng Professor, Department of Computer Science Associate Dean Research, Faculty of Engineering University of Victoria

Announcements

- Course website
 - http://www.engr.uvic.ca/~seng371
 - Lecture notes posted
- Labs this week
 - UML tools
 - · Available in the lab
 - ${}^{\textstyle \bullet}$ No need to bring your laptops or install software
- Assignment I
- Due Mon, Feb 4 (extension)
- · Cite your sources
- Part I Useful definitions
- Part II Growing systems in emergent organizations
- Part III Ultra large scale systems (ULS)

2

Autonomic Element

Consists of an Autonomic Manager (AM) and an Autonomic Element (AE)

Manager and managed element form a level of indirection

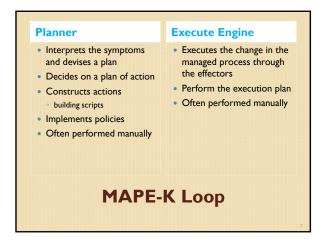

Spatially and temporally separate entities

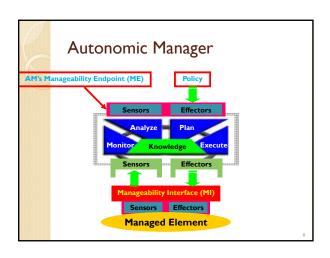

Enterprise Service Bus

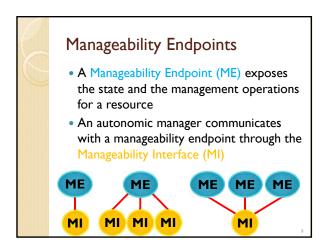

Managed Element

Level of indirection

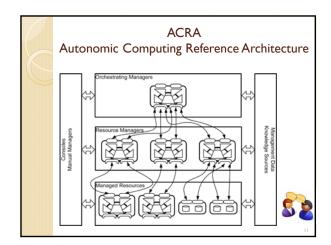

Monitor Analyzer Senses the managed Compares event data process and its context against patterns in the knowledge base to Collects data from the diagnose symptoms and stores the symptoms managed resource Provides mechanisms to Correlates incoming data aggregate and filter with historical data and incoming data stream policies stored in Stores relevant and critical repository data in the knowledge base Analyzes symptoms or repository for future Predicts problems reference. MAPE-K Loop

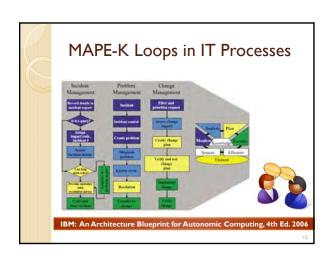

Manageability Interface • An MI for monitoring and controlling a managed resource consists of sensors and effectors • Sensors obtain data from the resource • read state variables in the ME • Effectors perform operations on the resource • call methods in the ME • Critical success factors for AC initiative • Separating AMs and MEs • Standardizing MIs

No Shortage of Complexity Industry Conquest Solutions

HP	Adaptive enterprise using OpenView
IBM	Autonomic computing
EDS	Agile enterprise
Hitachi	Harmonious computing
Dell	Dynamic computing
MS	Dynamic systems initiative

Industry's efforts
to emulate
Nature's Gold
Standard of
virtualization
software and
complexity

Self-Adaptive Systems Definition

- Self-adaptive software evaluates its own behavior and changes behavior when the evaluation indicates that it is not accomplishing what the software is intended to do, or when better functionality or performance is possible
- [DARPA Broad Agency Announcement on Self-Adaptive Software (BAA-98-12) in December 1997]
- This definition is quite useful and can be extended to include other quality criteria or extra-functional/nonfunctional requirements (i.e., not just performance)

1.4

Self-Adaptive Systems Definition

- A self-adaptive software system can alter its behaviour at run-time in response to changes in its environment
- · A self-adaptive system has the following abilities:
 - Accommodate dynamic change at run-time
 - Accommodate changes at run-time without shut down
 - · Assess its own behaviour
 - Observe its context or environment (i.e., anything observable)

P. Oreizy, M. Gorlick, R. Taylor, D. Heimbigner, C. Johnson, N. Medvidovic, A. Quilici, D. Rosenblum, A. Wolf: An Architecture-Based Approach to Self-Adaptive Software, IEEE Intelligent Systems, pp. 54-62, 1999.

Self-Adaptive Systems My Favourite Definition

- A self-adaptive system continuously adjusts its behaviour at run-time in response to its perception of its environment and its own state in the form of fully or semiautomatic self-adaptation.
- H. Giese, Y. Brun, J. Serugendo, C. Gacek, H. Kienle, H. Müller, M. Pezzè, M. Shaw.: Engineering Self-Adaptive and Self-Managing Systems, LNCS 5527, Springer, 2009.

14

Self-adaptive Systems: Anticipated and Un-anticipated Adaptation

- Anticipated adaption
 - The different contexts to be accommodated at run-time are known at design-time
- Un-anticipated adaption
 - The variation possibilities are recognized and computed at runtime
 - The decision which variant is best is computed using selfawareness and environmental context information
- Pure un-anticipated self-adaptive system are rare
 Most self-adaptive systems feature a combination of anticipated self-adaptation and un-anticipated self-adaptation
- Exercise: come up with a practical, technical example for each category

Self-Adaptive Systems Definition

- Self-adaptive software evaluates its own behavior and changes behavior when the evaluation indicates that it is not accomplishing what the software is intended to do, or when better functionality or performance is possible
- [DARPA Broad Agency Announcement on Self-Adaptive Software (BAA-98-12) in December 1997]
- This definition is quite useful and can be extended to include other quality criteria or extra-functional/nonfunctional requirements (i.e., not just performance)

Self-Adaptive Systems Definition

- A self-adaptive software system can alter its behaviour at run-time in response to changes in its environment
- · A self-adaptive system has the following abilities:
 - · Accommodate dynamic change at run-time
 - · Accommodate changes at run-time without shut down
 - Assess its own behaviour
 - Observe its context or environment (i.e., anything observable)

Self-Adaptive Systems My Favourite Definition

- A self-adaptive system continuously adjusts its behaviour at run-time in response to its perception of its environment and its own state in the form of fully or semiautomatic self-adaptation.
- H. Giese, Y. Brun, J. Serugendo, C. Gacek, H. Kienle, H. Müller, M. Pezzè, M. Shaw.: Engineering Self-Adaptive and Self-Managing Systems, LNCS 5527, Springer, 2009.

20

Self-adaptive Systems: Anticipated and Un-anticipated Adaptation

- · Anticipated adaption
 - The different contexts to be accommodated at run-time are known at design-time
- Un-anticipated adaption
 - The variation possibilities are recognized and computed at runtime
 - The decision which variant is best is computed using selfawareness and environmental context information
- Pure un-anticipated self-adaptive system are rare
 Most self-adaptive systems feature a combination of anticipated self-adaptation and un-anticipated self-adaptation
- Exercise: come up with a practical, technical example for each category

Key Questions

- What aspects of the environment should a self-adaptive system monitor?
- The system cannot monitor everything in the environment
- What aspects of the environment are truly relevant?
- How should a self-adaptive system react if it detects changes in the environment?
 - Maintain high-level goals
 - Relax non-critical goals to allow the system a degree of flexibility
 - Goal trade-off analysis

21

Key Questions

- What are the conditions that trigger adaptation?
- Response time
 - To address poor response times, a system might adapt itself by optimising resource utilisation
 - Fault-tolerance
 - To recover from a subsystem or device failure
 - Extension
 - · To accommodate new functionality at run-time

P. Oreizy, M. Gorlick, R. Taylor, D. Heimbigner, C. Johnson, N. Medvidovic, A. Quilici, D. Rosenblum, A. Wolf: An Architecture-Based Approach to Self-Adaptive Software, IEEE Intelligent Systems, pp. 54-62, 1999.

Key Questions

- Should the system be open-adaptive or closedadaptive?
 - With open-adaptive systems, new behaviours can be introduced at run-time
 - With closed-adaptive systems, all adaptive behaviour is fixed at design-time; once running a closed system cannot be made to do new things that were unanticipated when it was designed
 - Anticipated versus un-anticipated adaptation
- What type of autonomy must be supported?
 - Fully autonomous systems make their own adaptation decisions and carry them out unaided
 - Human-in-the-loop systems require inputs from humans, if only to OK proposed changes
 - Semi-autonomic versus fully autonomic systems

Key Questions

- · Under what circumstances is adaptation cost-effective?
- The benefits gained from making a change must outweigh the costs associated with making the change
- Costs include:
 - Performance and memory overhead of monitoring system

 - Monitoring is necessary to make adaptation decisions Memory may be limited on, particularly if adaptive software runs on embedded devices
 - Decision making—interpreting data gathered from monitoring may be computationally expensive
 - Executing the actions to actually change a system configuration
 - Changes involving physically distributed systems must be coordinated which itself incurs additional overhead

Key Questions

- How often should adaptation be considered?
 - Policies range from continuous (proactive) adaptation to as-and-when necessary (reactive)
 - Adaptation can also be opportunistic—exploiting resources such as CPU time when it is not being used for other tasks
 - "Go green" adaptation
- What kind of information must be collected to make adaptation decisions
 - Data can be gathered continuously
 - This provides precise and up-to-date observations, but incurs relatively high cost

 Data can be gathered less often with the resulting samples being approximations of environment activity: this approach imposes less overhead
 - Trust issues

Major Drivers for Self-Adaptive Systems

- Autonomic Computing: self-managing systems
- **Ubiquitous Computing:** changing environments
- Ubiquitous computing (ubicomp) is a post-desktop model of human-computer interaction in which information processing has been thoroughly integrated into everyday objects and activities.
- As opposed to the desktop paradigm, in which a single user consciously engages a single device for a specialized purpose, someone "using" ubiquitous computing engages many computational devices and systems simultaneously, in the course of ordinary activities, and may not necessarily even be aware that they are doing so.
- This paradigm is also referred to as pervasive computing, ambient intelligence, or everyware.

Class Participation Assignment

- Pick a self-managing scenario
- Define managed resources
- Define managing goals
- · Define trade-off choices

Presentation notes

- Rob, Anita, Jordan, George
 - S Wireless Network
 - R Hardware, routers, bandwidth, connection
 - G Availability, security, connections speed, maintenance
 - T Availability vs user base, availability vs. maintenance, availability vs. connections speed
- · Brandon, Amanda, Romil
 - S Backup over a network
 - R Storage, network, CPU
 - G Back ups on time, back up is verified, security, CPU available for other tasks
 - T Time management/size, CPU management, CPU load, network load

Presentation notes

- Justin, Allen, Mikko
 - S Library
 - $^{\circ}~$ R Books, Money, Computers, Staff
 - G New books, more computers, More staff
 - T Limited funds, limited space
- Y, Sam, Mack
 - S Hospital
 - $^{\circ}~$ R Staff, drugs, equipment, space
 - $\circ~G$ Maximize space efficiency, maximize staff, lower cost, raise standards
 - T Money vs Staff, Time vs Cost

Presentation notes

- · David, Daniel, Brad, Ian
 - S Cloud based webservice
 - 。 R Servers, Database, Load balancer
 - $^{\circ}~$ G Maximize speed and availability, lower cost
 - T Speed vs Availability (limit bandwidth of users), Speed vs Cost, Availability vs Cost
- · Wes, Curtis, Jeremy, Kai
 - ∘ S Send people to space
 - R Oxygen, Pressure, Temperature, Lights, Time
 - G O2 > 20%, ...
 - T Temperature vs Pressure, basic chemistry

32

Presentation notes

- Paul, Scott, Marc
 - S Grocery Store
 - 。 R Product stock, Back stock, Employees, Space
 - 。 G Keep produce fresh, conserve space, staff numbers
 - T Order vs Back stock, More staff vs Less staff, costs and trends
- Mike, Geoff, Adam
 - ∘ S AI for a video game (FPS)
 - R Position, health, ammo, objectives
 - G Survive, Aggression, Conservative, Orders
 - $^\circ$ T Sacrifice position and ammo to recover health, sacrifice health to capture an objective

Presentation notes

- · Richard, Nick, Vish
 - S Server farm
 - R Main server, VM, ressource servers
 - $^{\circ}~$ G Cost, save energy, servers
 - $^{\circ}~$ T Smaller VM's, centralized server vs many servers, security
